

Current class name

How to find the name of a class or method that is currently running?

To get the names, simply create a new exception and check a stack trace!

```
HandledException handledException = new HandledException();  
System.debug(handledException.getStackTraceString());
```

```
Class.ExampleController.run: line 3, column 1  
Class.AccountsController.runTest: line 14, column 1
```

Now let's get only names of Class and Method as Strings:

```
public class ExecutionUtils {  
    public static String getRunningClass() {  
        HandledException handledException = new HandledException();  
        return handledException.getStackTraceString()  
            .substringAfterLast('Class.')  
            .substringBefore('.');  
    }  
  
    public static String getRunningMethod() {  
        HandledException handledException = new HandledException();  
        return handledException.getStackTraceString()  
            .substringAfterLast('Class.')  
            .substringBefore(':')  
            .substringAfter('.');  
    }  
}
```

```
22:27:55.81 (98588124) |USER_DEBUG|[3]|DEBUG|ExampleController  
22:27:55.81 (98702496) |USER_DEBUG|[4]|DEBUG|run
```
