

# Prevent record save in Apex

Did you know that:

**You can create validations in the Apex trigger code to prevent the insertion of selected records?**

```
for (SObject record : Trigger.new) {  
    if (!isValid(record)) {  
        throw new DmlException();  
    }  
}
```

Prevent saving only records that failed validation:

```
for (SObject record : Trigger.new) {  
    if (!isValid(record)) {  
        record.addError('Validation failed!')  
    }  
}
```
